## Moving to the Forefront: Teaching Mathematics in the Middle Grades

Karen Karp, University of Louisville  
AMTE President

### Inside this issue:

2004 AMTE Conference: Preview and Registration Info	3-13
“Bookshelf” Review: <i>Standards-Based School Mathematics Curricula</i>	14, 19
JMTE Highlights	15
<b>THEORY &amp; PRACTICE:</b> No Child Left Behind	16-18

“In many post-secondary institutions the number of prospective middle school mathematics teachers is small and these pre-service teachers have no distinct identity.”

The middle grades remains a unique period of time in students’ development and, as such, provides both challenges and opportunities for those who prepare teachers of middle grades mathematics. The onset of adolescence brings both biological and cognitive changes that influence students’ lives and the distinctive ways in which they learn. The middle grades is a period of transition for students. At the level of teacher preparation, middle school pre-service teachers are often in an unusual position. In many post-secondary institutions the number of prospective middle school mathematics teachers is small and these pre-service teachers have no distinct identity.

At this writing many states do not have specific certification programs for middle grades mathematics. Teachers of middle grades mathematics, in these states, typically have certification as either secondary teachers of mathematics (grades 7-12), elementary education, or a variety of other fields. In states with middle grades certification, pre-service teachers often take mathematics content courses with elementary education students and take their mathematics methods course with secondary mathematics education students, or vice versa. Because some states require certification in two subject areas for middle school teachers, pre-service middle grades mathematics teachers’ fieldwork is often split between mathematics and another discipline.

This unique situation of middle school pre-service mathematics teachers is a challenge for many AMTE members. This challenge centers on finding ways to provide the depth and breadth in mathematics education needed to accelerate the development of a strong cadre of middle school mathematics teachers and in promoting middle grades

mathematics certification in those states not having such licensure programs. (Read AMTE member Johnny Lott’s current presidential message in the *NCTM News Bulletin* about recommendations for quality middle grades programs)

For three years beginning in 1995 NSF supported the MIDDLE MATH project, which facilitated the teaming of mathematics faculty and mathematics education faculty with the goal of exploring the content and pedagogy critical for those who taught mathematics at the middle grades level. Led by AMTE member Sid Rachlin, there was a recognition that the success of the reform movement would depend on both the pre-service preparation and in-service professional development of teachers. The leaders of the initiative hoped to have a major effect on how mathematics was taught by a) examining the implications of the NSF-sponsored curriculum projects, b) sharing knowledge of middle school teacher preparation programs at several institutions, and c) discussing issues related to assessment, technology and preparing culturally-responsive teachers.

In 1998 a document was developed from this examination that captured the essential ideas that could strengthen the preparation of middle grades mathematics teachers. The document conveys strategies for engaging students and creating learning environments through considering implications of the following curricula: The Connected Mathematics Project, Math in Context, Middle-school Mathematics through Applications, Math Scape: The Seeing and Thinking Mathematically Project, and Math Thematics: Six Through

## AMTE Business

### Second Affiliate Group Approved

The Utah Association of Mathematics Teacher Educators has been accepted as AMTE's second affiliated group. Their charter will be formally presented at the AMTE 2004 conference in San Diego.

### 2003-2004 Project NExT Fellow

The AMTE Project NExT Fellow for 2003-04 is Mika Munakata, who is on the faculty at Montclair State University. Mika received her Ph.D. in mathematics education last year from Columbia University, writing a dissertation entitled "Estimation Skills in Secondary School Students: Relationships Among Strategy Use, Attitude Toward Estimation, and Category Width in Students Grade 5-11." Her research plans include investigations of teachers' attitudes towards estimation in the mathematics classroom and teachers' responses to students' questions about common mathematical procedures.

### Proposed Dues Increase

The AMTE Board of Directors has recommended an increase in membership dues, to \$45.00 for regular members (a \$10 increase) and \$22.50 for student members (a \$5 increase). This proposed increase will be voted on at the Annual Business Meeting at the AMTE Conference in San Diego in January 2004 and if approved would go into effect following the conference. Membership dues were first set at \$10 in 1993, increased to \$20 in 1997, and increased to \$35 in 2000.

In the past few years, services to AMTE members have increased, including the publication of the *Recommendations for Doctoral Programs* and the AMTE history document, expansion of the newsletter, and the development of a series of monographs (members will receive complimentary copies). Rising costs have also made even routine budgetary items increase at a rate that outpaces our current dues structure. These services and benefits require additional funding, which the dues increase to \$45.00 will provide.

**The Association of Mathematics Teacher Educators (AMTE)  
Eighth Annual Conference**

San Diego, CA - January 23 - 24, 2004

The Eighth Annual Conference of the Association of Mathematics Teacher Educators (AMTE) will be held in San Diego, CA, from Friday, January 23, through Saturday, January 24, 2004. Conference activities will begin with a Pre-conference Symposium and Dinner on Thursday evening, January 22, 2004.

**REGISTRATION INFORMATION**

The conference registration fee includes admission to all regular sessions and the Browsing Room. In addition, a large portion of the fee includes continental breakfast, lunch, dinner, and afternoon break on Friday and continental breakfast and lunch on Saturday. With your conference registration, you can renew your membership in AMTE by paying the \$35 dues (\$17.50 for students). The table found on the Conference Registration Form details the categories of registration. Notice that registration costs vary by postmark date and total registration is limited, so we encourage you to register early.

**PRE-CONFERENCE SYMPOSIUM and DINNER**

The AMTE Pre-conference Symposium and Dinner will be held on Thursday, January 22, 2004 from 5:30 – 8:30 p.m. A separate registration fee of \$45 will be charged and includes dinner. Please note that on-site registration is not available for the Pre-Conference Symposium; please make sure to register in advance for the Pre-Conference Symposium as it will be limited to the first 150 registrants.

**HOTEL RESERVATION INFORMATION**

To reserve your room for the conference, call the phone number listed below or make your reservations online via the AMTE website. Be sure to mention the “Association of Mathematics Teacher Educators” conference when you call. The reservation deadline for the hotel is Friday, December 19, 2003.

Marriott Mission Valley Hotel  
8757 Rio San Diego Drive  
San Diego, CA 92108  
TEL: 1-800-842-5329 (Reservations)

Single or Double Occupancy: **\$134 per night**  
Reservations must be made by **December 19, 2003**.

Driving directions and other related travel information has been made available on the AMTE web site.

Reservations made after **December 19, 2003** will be accepted on a space-available basis at the hotel’s prevailing rate.

“With your conference registration, you can renew your membership in AMTE .”

**ASSOCIATION OF MATHEMATICS TEACHER EDUCATORS  
EIGHTH ANNUAL CONFERENCE  
January 22 – 24, 2004 San Diego, CA**

registration!

### NCTM at the AMTE Annual Conference

NCTM is pleased to be in attendance among the teacher educator leaders in mathematics education to support teacher educators and our common goal of supporting pre-service teachers of mathematics.

You will find NCTM's participation throughout the conference, including the following activities:

- Two half-day pre-session workshops on the new NCATE mathematics program review guidelines (see below)
- NCTM President Johnny Lott's session
- A session by NCTM's President-Elect Cathy Seeley
- A session to learn more about starting your own NCTM Student Affiliate
- Display of new publications and resources in the Browsing Room
- And finally, join NCTM for a **special treat for you** at Friday's luncheon and a discussion of the value and benefits of student membership.

NCTM will be in San Diego and looks forward to seeing you there!

### NCTM Sponsors Two Pre-conference NCATE Workshops

Two institutional workshops for those preparing NCATE mathematics program reviews for 2006 and beyond will be offered on Thursday, January 22 at the AMTE annual meeting. One workshop will be offered from 8:30 until 11:30 a.m. and a repeat of the workshop will be offered from 1:30 until 4:30 p.m.

The workshop will include a discussion of the NCATE mathematics standards for elementary mathematics specialists, middle school mathematics teachers and high school mathematics teachers. An overview of the required program review matrix will be provided. A question and answer session will follow the presentation.

Presenters will be Connie Schrock, Emporia State University; Gladis Kersaint, University of South Florida; Jan Vandever, University of Alaska-Matsu, and Marilyn Hala, NCTM's NCATE Program Review Coordinator.

To sign up for this pre-session e-mail [ncate-workshop@nctm.org](mailto:ncate-workshop@nctm.org). Please indicate if you prefer the morning or afternoon session.

### CPTM: Mathematics for Teaching Pre-Conference Workshop

The Center for Proficiency in Teaching Mathematics (NSF Centers for Teaching and Learning) will sponsor a pre-conference to the AMTE Annual Conference focusing on teachers' learning of mathematics for teaching. The pre-conference is limited to 25 participants and pre-registration will be required. The pre-conference will be held Thursday, Jan. 22 from 9am-4pm. (Pre-conference check-in will begin at 8:30am.)

The session will focus on approaches to developing teachers' mathematical proficiency that emphasize using mathematical knowledge in teaching. We'll explore how to connect teachers' opportunities to learn mathematics to teaching practice.

To learn more about the pre-conference and how to apply, go to <http://cptm.us/AMTE>.

### (CM)<sup>2</sup>/Show-Me Pre-Conference: Mathematical Preparation of Middle School Mathematics Teachers

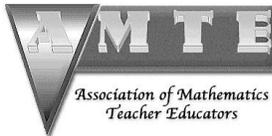

The Show-Me Project (NSF Middle School Curriculum Center) and the Connecting Middle School and College Mathematics Project (three-year NSF project) will jointly sponsor a pre-conference focusing on the mathematical preparation of middle school mathematics teachers. The pre-conference is limited to 60 participants and pre-registration is required (a registration fee of \$25 will cover lunch and handout materials).

The pre-conference will be held Thursday, Jan. 22, from 11:00 – 4:30 (pre-conference check in between 10:00-11:00). Sessions will include:

- Overview of the state of middle school mathematics certification in the US
- The MET recommendations for middle school mathematics teachers
- Showcasing content materials for the mathematical preparation of middle school mathematics teachers
- Panel discussion on developing partnerships between mathematics educators and mathematicians in organizing and teaching mathematics content courses for middle school teachers.

For additional information and to register for the pre-conference, see the following website: <http://showmecenter.missouri.edu/AMTE>.

“for those preparing NCATE mathematics program reviews for 2006 and beyond”

**AMTE Pre-Conference Program  
Thursday, January 22, 2004**

**Thursday, 1:30–4:30 p.m.  
Pre-Conference Technology Workshop**

***Multimedia Case Studies***

Two teams of teacher educators report on their research and experiences using multimedia cases with preservice and inservice teachers. Participants will be invited to discuss ways in which they might use these resources, as well as issues related to their use.

**Prospective Teacher Educators' Developing Perspectives on Teacher Education Through the Creation of Multimedia Case Studies**

Joanna O. Masingila, Syracuse University  
Bulent Cetinkaya, Syracuse University  
Levi Molenje, Syracuse University

**Using Multimedia Case Studies to Help Teachers Learn about Inclusion in the Elementary Mathematics Classroom**

Babette Moeller, EDC/Center for Children and Technology  
Barbara Dubitsky, Bank Street College of Education  
Karen Marschke-Tobier, Bank Street College of Education  
Harold Melnick, Bank Street College of Education  
Linda Metnetsky, Bank Street College of Education

Attendance at the Pre-conference Technology Workshop is free, but pre-registration is required. The Workshop is limited to the first 26 registrants.

**Thursday, 5:30–8:30 p.m.  
Pre-Conference Symposium & Dinner**

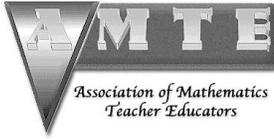

***The Role of Teacher Educators as Leaders***

Cathy Seeley, University of Texas at Austin  
President-Elect, National Council of Teachers of Mathematics

Teacher educators play a critical role in the future of mathematics education. Come think about what you can do as a leader to support the improvement of mathematics teaching and learning in your community and beyond.

5:30-7:00 p.m. Presentation  
7:00-8:30 p.m. Dinner

A separate registration fee of \$145 is required for the Pre-Conference Symposium and Dinner. Attendance is limited to the first 150 registrants.

**Preliminary Program**  
**Eighth Annual AMTE Conference**  
**Friday, January 23 – Saturday, January 24, 2004**

**Friday, 7:00–8:00 a.m.**

Continental Breakfast

**Friday, 8:00–9:30 a.m.**

**Adapting Professional Development Materials for Preservice**

Nanette Seago, San Diego State University

**The Role of Mathematics Teacher Education: Reform or Enculturation?**

Thomas J. Cooney, University of Georgia (emeritus)

What do different stakeholders such as teachers, parents, students, and administrators bring to the enterprise of mathematics teacher education? These perspectives combined with professional statements such as the NCTM Standards, society's expectations for education more generally, and past scholars' views on education contribute to a climate that also helps define the role of mathematics teacher education. Do these various perspectives define a role that leads to reform or to enculturation? Issues and tensions in defining the role of mathematics teacher education will be addressed.

*AMTE Business Meeting*

## From The Mathematics Teacher Educator's Bookshelf: A Review of *Standards-Based School Mathematics Curricula*

*Judith E. Jacobs, California State Polytechnic University, Pomona*

In *Standards-Based School Mathematics Curricula: What are They? What do Students Learn?*, Sharon L. Senk and Denisse R. Thompson provide documentation that addresses the question of how mathematics curricula impact student learning. The studies presented in this volume discuss 12 standards-based programs that were produced in response to the 1989 NCTM *Curriculum and Evaluation Standards for School Mathematics*.

The book is divided into five sections. The first and last sections consist of one chapter each. The first chapter presents the historical context for the development of the 12 programs as well as a discussion of research issues related to curricula. The last chapter provides a critical analysis of the findings presented in the book and the nature of the task of evaluating the impact on curricula on student learning.

Each of the three additional sections focuses on one of the grade spans: elementary, middle or high school. Each of these sections begins with an overview chapter that presents summary data on student mathematics achievement at that level and information on the NCTM *Curriculum and Evaluation Standards for School Mathematics*' expectations for that grade span. Chapters that address research findings on a particular standards-based program and student outcomes follow this introductory chapter. The section concludes with a chapter that discusses common themes across the programs as well as issues related to the research presented.

Four programs, *Math Trailblazers*, *Everyday Mathematics*, *Investigations*, and *Number Power* are discussed in the elementary programs section. The middle school section presents information on *Connected Mathematics*, *Mathematics in Context (MiC)*, and *Middle Grades MATH Thematics: the STEM Project*. At the high school level, *The Core-Plus Mathematics Project*, *MATH Connections*, *Interactive Mathematics Program*, *SIMMS integrated Mathematics*, and the UCSMP Secondary School Curriculum are

the programs detailed.

So, did the programs "work?" Jeremy Kilpatrick (p. 483) in the final chapter states that the research presented demonstrates "... the tendency of students in new curricula to perform at the same level as comparison students on standardized tests and to perform at higher levels on specifically designed tests." These results, he points out, mimic the results found when evaluating the curricula from the new math era. He, as did the authors of the summary chapters for each grade span, offers a detailed analysis of problems with the research designs for the studies presented. Some of the causes of concern were the appropriateness of the measures used, the comparability of the experimental and control groups of students, and the impact of teacher effects.

Given the lack of rigor of the research studies reported and the dated nature of the material (We now have a new NCTM standards document.), is the book worth reading? To that question I give an unqualified yes. The true value of this volume is not in what is reported but how the information in the book is presented. This book is a gold mine. It allows mathematics teacher educators to have a one-volume resource from which their students can learn some of the recent history of mathematics education while sharpening their research evaluation skills. Following are some of the serendipitous treasures in this book.

The first chapter by Senk and Thompson and the last chapter by Kilpatrick provide newcomers to mathematics education a brief introduction to the history of the "new math" and the "math wars." Part of that history documents the role that the National Science Foundation played in creating mathematics curricula. It also provides readers with a sense of why NCTM's 1989 *Curriculum and Evaluation Standards for School Mathematics* was such a revolutionary document. Kilpatrick (p. 474) provides a concise comparison between the new math and current standards-based mathematics curricula. The curricula from both eras deemphasized procedures and emphasized understanding. The critical difference between the programs from these two eras is they way the programs attempt to

## Journal of Mathematics Teacher Education (JMTE)

The Journal of Mathematics Teacher Education is devoted to topics and issues involving the education of teachers of mathematics at all stages of their professional development. JMTE will serve as a forum for research on teachers' learning, for considering institutional, societal, and cultural influences that impact the education of mathematics teachers, and for creating models for educating teachers of mathematics. Critical analyses of development initiatives, technology, assessment, teaching diverse populations, policy matters, and developments in teaching as these topics relate to educating mathematics teachers are welcome. Critiques of reports or books that affect mathematics teacher education will appear as appropriate. In general, JMTE encourages the submission of articles that identify, examine, and develop areas of knowledge related to mathematics teachers' learning and development.

### Selected Articles from JMTE in 2003:

- Editorial: What Does "Design Research" Offer Mathematics Teacher Education? *Terry Wood, Betsy Berry*
- Learning to Learn to Teach: An "Experiment" Model for Teaching and Teacher Preparation in Mathematics, *James Hiebert, Anne K. Morris, Brad Glass*
- The Role of Mathematics Teachers' Content Knowledge in their Teaching: A Framework for Research Applied to a Study of Student Teachers, *Jeremy A. Kahan, Duane A. Cooper, Kimberly A. Bethea*
- Interconnecting Content and Community: A Qualitative Study of Secondary Mathematics Teachers, *Andrea Lachance, Jere Confrey*
- Study Groups as a Form of Professional Development for Secondary Mathematics Teachers, *Fran Arbaugh*
- Teachers and 'Street Children': On Becoming a Teacher of Mathematics, *Renuka Vithal*
- Four Student Teachers' Pedagogical Reasoning on Functions, *Victoria Sánchez, Salvador Llinares*
- Adapting Reform Ideas in Different Mathematics Classrooms: Beliefs Beyond Mathematics, *Paola Sztajn*

## Moving to the Forefront

(Continued from page 1)

Eight Mathematics. This work describes not only the content that is needed in middle school classrooms but also in college coursework. In addition, chapter-long case studies describe how institutions worked to improve the preparation of middle school mathematics teachers through field experiences, improving their beliefs and attitudes, assessments, technology integration and specific mathematics content courses. In many cases, actual examples of problems used in the methods classrooms were shared.

AMTE members contributed to these case studies by providing detailed information about their programs and courses. AMTE member Ed McClintock and his colleague Zhonghong Jiang at Florida International University shared a program that provided middle school certification in technology education as well as in mathematics. AMTE member Doug Owens described how Ohio State's integrated program included mathematics, science and technology, while AMTE member Susan Beal detailed an innovative two-course sequence called "Math and Cognition for the Middle School" offered at St. Xavier University. AMTE Board member, Susan Friel at the University of North Carolina – Chapel Hill, shared how focusing on three central components of teaching, mathematics content, mathematics pedagogy and middle grades students' thinking about mathematics, can create a framework upon which a strong program can be based. Denisse Thompson and Michael Chappell, both AMTE members, revealed detailed descriptions of possible assessments for a middle grades mathematics methods class used at the University of South Florida. These chapters present precisely the kind of information needed as AMTE members work to revise and refine their courses and programs for middle grades mathematics teachers.

Although this work was completed in 1998, the issues are just as relevant and significant today as they were five years ago. AMTE has decided to publish *MIDDLE MATH: Improving the Preparation of Teachers of Middle Grades Mathematics* as a resource for AMTE members. Members will receive this monograph during the current academic year and AMTE hopes it will be useful to all members as a catalyst for conversations about teaching middle grades mathe-

matics and as a resource for conversations about the status and need for change in middle grades mathematics education at their institutions.

In another project that focused on the teaching of mathematics at the middle grades level, the national group, Achieve, Inc., created a draft document entitled *Foundations for Success* (2002), which can be read or downloaded at (<http://www.achieve.org/achieve.nsf/MAP?openform>). Achieve, Inc. is an independent, bipartisan, non-profit organization overseen by a board of governors and corporate leaders. Its mission is to help states improve schools by benchmarking their academic standards and assessments against the best national and international examples, providing sustained public leadership and advocacy to raise standards and student performance, and serving as a resource center for standards-based reform.

Achieve's Mathematics Achievement Partnership (MAP) draft document describes the core knowledge and skills that middle school students (and teachers) must master in preparation for high school. AMTE was officially invited to respond to MAP's *Foundation for Success* with a formal review. AMTE member Jenny Bay-Williams took the lead in organizing the project. An email message was sent to AMTE members requesting participation in this analysis. A number of well-qualified experts at the middle grade level responded. AMTE selected a task force composed of: Rick Billstein, Brian Boyd, Linda Braverman, Margaret Buerman, Joseph Dalin, Melissa Freiberg, Terry Herrera, Cathy Kinzer, John Luedeman, Michael Lutz, Mika Munakata, Maggie Niess, Karen Norwood, Clara Nosegbe Okoka, Diane Resek, Bill Speer, Denisse Thompson (and a group of her graduate students), Tad Watanabe, and Judy Werner. The task force reviewed the document: a) for clarity of vision and purpose, b) to determine whether an "actionable" vision of middle school mathematics teaching and learning was communicated, c) for the appropriateness of the content strands and topics, d) for the degree of alignment with key national documents (e.g. *Principles and Standards for School Mathematics* (NCTM, 2000), *Mathematical Education of Teachers* (CBMS, 2001)), and e) to evaluate the quality of the sample mathematics tasks. The official review is found at the "Position Papers and Publications" section of the AMTE website at [www.amte.net](http://www.amte.net).

AMTE is providing resources and oppor-

"These chapters present precisely the kind of information needed as AMTE members work to revise and refine their courses and programs for middle grades mathematics teachers."

(continued from previous page)

mathematics content and pedagogy as well as the core knowledge needed by middle grades students. The middle grades deserves a special emphasis in light of the key transitions of students that occur in the period between elementary and high school years. By moving issues

related to middle grades mathematics teaching to the forefront of our thinking and seeking ways to connect pre-service teachers with the mathematics content and pedagogy most appropriate for middle grades students, our teacher education programs can improve in important ways. •

## ***THEORY & PRACTICE:*** **Responses to No Child Left Behind**

P. Mark Taylor, University of Tennessee

The legislation known as No Child Left Behind (NCLB) and its implementation at the federal and state levels has been the focus of a lot of attention in recent months. Many states still have a K-8 certification with a limited amount of mathematics required. As a result, those states are scrambling to find ways to react to NCLB's call for "Highly Qualified Mathematics Teachers." Each state had to begin by defining what it means to be highly qualified. This call also places urgency on the hiring of Highly Qualified Mathematics Teachers for high school for those schools where out-of-field teaching is a regular occurrence.

How does this effect mathematics teacher educators? The question was put to AMTE members: "How are you and your institution responding to the dilemmas presented by No Child Left Behind and the call for highly qualified mathematics teachers?" Four responses to this question are included for your consideration.

### **Alan Zollman, Northern Illinois University**

One of my personal concerns is the vague wording of "Call for Highly Qualified Mathematics Teachers." The problem is the confusion between "highly qualified" and "high quality." In the Mathematical Sciences Department at Northern Illinois University we view "highly qualified" as meeting the requirements of our programs. Our graduates are "highly qualified" but not necessarily "high quality," at least in their first several years of teaching.

Our department's expectations are higher than the state minimum. Simultaneously, we also stress our incentives for doing our program: excellent placement of our graduates, sound content knowledge of mathematics, nurturing sequence of courses preparing for student teaching, even a mathematics minor available for elementary education majors.

The mathematics educators in Illinois formed an association (IMTE) to have a coordinated voice and communication with the

state board of education. IMTE members volunteer and serve on state committees. NCLB is a dilemma but possibly also an opportunity.

### **Denise Mewborn, University of Georgia**

At this point, I think it would be a bit of a stretch to say that we are doing something specific to respond directly to NCLB. However, many of the things that we are already doing address the need to have a highly qualified mathematics teacher in every classroom. A few examples: We are working with particular school districts to offer masters degrees in mathematics education to cohorts of elementary or middle school teachers.

The State of Georgia has recently changed middle school certification to require a subject matter-specific certification rather than a general middle school certification. Our preservice middle school program has long offered a specialization in mathematics, but we have recently added a new course to reflect the current emphasis in many districts on algebra in the middle school. Through Project InterMath (<http://www.intermath-uga.gatech.edu/>) we are leading a statewide effort to upgrade the qualifications of inservice middle school teachers who teach mathematics.

We are working to develop a mathematics endorsement (add-on to a teaching certificate) for preservice and inservice elementary teachers. This endorsement will consist of a sequence of 3 mathematics content courses and 2 mathematics methods courses.

We have numerous professional development projects supported by Teacher Quality or National Science Foundation funding to work with teachers in particular schools (or clusters of schools) to improve their mathematical content knowledge and pedagogy. In many of these projects we are working with teachers to look carefully at test results (both externally-mandated and local tests) to determine what these data tell us about student learning.

(Continued on page 18)

"How are you and your institution responding to the dilemmas presented by No Child Left Behind and the call for highly qualified mathematics teachers?"

The problem area in Oregon is with the middle school where it has been said that at least 56% of the teachers are not “highly qualified” for teaching the core subject areas.

*(Continued from page 17)*

Some of our faculty are involved in the writing and review of the state's curriculum objectives in mathematics. Georgia is attempting to create a more rigorous and meaningful set of objectives to enhance student learning state-wide.

We have created a track in our Education Specialist degree program (Ed.S.) for teachers who wish to pursue National Board certification. This program is a collaborative effort with faculty in science education and English education. The primary goal is to provide a cohort of teachers with a supportive structure in which to pursue certification and a degree. Another goal is to infuse elements of the standards from the National Board process into our graduate classes for practicing teachers.

Finally, we are giving more explicit attention to state and federal legislation and to issues surrounding externally-mandated, high stakes assessment in our teacher education courses.

#### **Barbara Dougherty, University of Hawaii**

The Curriculum Research & Development Group of the University of Hawaii has received a higher-education grant from NCLB funds to support teacher development in the elementary grades. The professional development, part of a larger elementary research and development project called Measure Up, focuses on enhancing teacher content knowledge in algebra and measurement. With the emphasis on research, the professional development content uses a theoretical basis from the work of Davydov and Elkonin (see the Soviet Studies Series from NCTM) that suggests that students should learn mathematics from a generalized standpoint, rather than from a number perspective. To communicate the mathematics in this context, students must rely on an algebraic system which leads to the use of variables in grade one, long before numbers are introduced.

With this perspective, teachers look at the mathematical content in a different way. But, specifying content is only one small part of the professional development. Our grant supports continued professional development experiences throughout the school year but in a different way from most sessions. Since our group is affiliated with a research school, we, as faculty members, teach in those classes that are related to our research work. Thus during follow-up sessions, the grant is helping us support teachers to visit our classes so that they

can observe students doing mathematics in a different way and interact with teachers who are using a non-traditional pedagogical approach. This creates a marriage between the professional development experience and the classroom.

#### **Maggie Niess, Oregon State University**

Under the No Child Left Behind mandate, “Highly qualified” is defined as a bachelor’s degree and a mathematics endorsement to demonstrate that mathematics teachers have clear knowledge of the mathematics they teach. In Oregon this mandate has not seemed to present difficulties for the many preservice teacher preparation programs in preparing their mathematics education students to be mathematics teachers. As several mathematics education professors have said, “We will continue doing what we have done.” But we really cannot afford to look at the problem like this!

The problem area in Oregon is with the middle school where it has been said that at least 56% of the teachers are not “highly qualified” for teaching the core subject areas. Over the past 10 or 15 years middle school principals have preferred to hire generalists in response to research suggesting that adolescents learn better when taught by one teacher throughout the day. The question is how these teachers will gain the “highly qualified” status.

One strategy to deal with this problem has been that the Oregon Teacher Standards and Practices Commission has adopted some temporary rules (OAR 584-100-0022) to designate middle level teachers “highly qualified” in their content areas if they perform in the “average performance range” on the appropriate subsections of the Multiple Subject Assessment Test (MSAT). As the new regulations says “If the candidate meets or exceeds 77.5% of the total points available in a core academic subject matter area, the candidate meets the requirements for having passed a rigorous state test in the core academic subject matter area at the middle level only.” That means that possibly getting as few as 10 of 24 multiple choice questions correct on the MSAT tests allows a middle school mathematics teacher to be labeled “highly qualified.”

Another strategy that I have been involved with has been to develop a district-wide inservice program for all the teachers teaching mathematics (middle and high school) over the entire school year with an expressed intent of

*(Continued on page 19)*

(Continued from page 18)

helping teachers prepare for the mathematics endorsement test. But we are using this opportunity to do more than simply prepare them to pass the test. The focus will be on increasing their content knowledge along with their knowledge of State and National Standards and knowledge of effective pedagogical practices for teaching mathematics. Additionally, we are providing supervision and assistance as they implement their knowledge in teaching mathematics. And, we have required that at

least two of the teachers be supported in attending the annual NCTM conference along with the instructor to bring back ideas and materials to share with the other teachers in the program. It seems to me that this approach has a better chance of making a difference in children's understanding of mathematics.

How are you responding? To continue this discussion, log on to the AMTE Discussion Forum at <http://www.webct.com/amte/>. •

## THEORY & PRACTICE Question for the March Issue of *AMTE Connections*: Framework for a Methods Courses

How would you describe the current framework for your mathematics methods course? What are the main goals and how are they achieved?

AMTE members are urged to respond to this question. Responses will be summarized and/or quoted. You may submit your answer by posting a response to the questions on the AMTE Discussion Forum (<http://www.webct.com/amte/>) in the "General Discussion" area. Responses submitted by February 1 will be considered for inclusion.

### *Standards-Based Mathematics*

(Continued from page 14)

achieve these goals. The new math used mathematical structure and the standards-based programs used mathematical problems that had a real-world context. The analysis of this statement and how it played out could be the subject of a semester long analysis of the history of mathematics education from the Sputnik age to today. It also provides a frame of reference for discussions about the role of mathematicians in mathematics teacher education and curriculum development.

Here are some more tasks we could assign our graduate students if they had *Standards-Based School Mathematics Curricula: What are They? What do Students Learn?* Almost all of the 12 programs were designed in response to a NSF call for proposals. One could ask to what degree the programs addressed the NSF guidelines. What goals did each program establish for itself? Did they attempt to measure all of these goals? How did they measure these goals? In what ways was the instrumentation appropriate or inappropriate? How did the programs attempt to have a control group? In what ways were their efforts problematic?

Our students could also examine the mathematics in these programs. Each program presents some mathematics that is

representative of its curriculum. In many ways, these examples of what standards-based mathematics can look like provide a common basis for discussions of what good mathematics is.

And, for us as mathematics teacher educators, there are many implications for our work. One key issue in evaluating the evaluation results reported by the programs is to what degree did teacher effectiveness and loyalty to the curriculum impact the results? All these programs required, to a greater or lesser degree, professional development in both mathematics and pedagogy. What role do we play in providing this professional development? If those of us who prepare mathematics teachers prepare them to deliver standards-based teaching no matter what program they teach (even when teaching \_\_\_\_\_ Math), how will those evaluating the impact of mathematics curriculum separate the effects of the content of the program from the pedagogy of the program?

As I read *Standards-Based School Mathematics Curricula: What are They? What do Students Learn?* by Senk and Thompson, I kept finding more and more questions that I wanted to discuss with my colleagues or have my students explore. This book is a valuable resource for a mathematics teacher educator's bookshelf, but not necessarily for what it

"...I kept finding more and more questions that I wanted to discuss with my colleagues or have my students explore."
